

# Corina Nicoleta Sebesan

Senior Software Engineer

Timisoara, Romania · sebesan.corina@gmail.com

[linkedin.com/in/corina-nicoleta-sebesan](https://www.linkedin.com/in/corina-nicoleta-sebesan) · [github.com/corinasebesan](https://github.com/corinasebesan)

Around seven years of commercial experience, all of it on long-lived products. Five of those years were production C# and .NET on a desktop and web analytics platform. Seven were TypeScript, across Angular and Preact. What I am best at sits under the feature: shared component libraries, design systems, and the contracts that hold a large codebase together while it grows.

## SKILLS

**Core:** TypeScript, JavaScript, Angular (NgRx, RxJS, Reactive Forms), Preact/React, CSS, SCSS, design systems, C# / .NET, HTML

**Working with:** Node.js (Express, NestJS), REST APIs, MySQL, SQL, Docker, Azure Pipelines, Helm, AKS, Jenkins, Git

**Testing & tools:** Unit testing, Jasmine, Cypress, New Relic, Figma, Claude Code, JIRA, Confluence

**Also:** Python (scikit-learn, TensorFlow, OpenCV), Kotlin, Java, Android SDK, Linux administration

## EXPERIENCE

### Frontend Developer, DevHub (2025 - Jul 2026, Timisoara)

- A multi-brand platform: **six consumer applications sharing two internal Angular component libraries**, all of them built and operated in house. A brand turns on a whole feature by adding one provider line to its configuration, and any change to a shared component has to be checked against five applications I was not testing in.
- Helped migrate the codebase **from Angular 11 to Angular 20**, in both the current and the legacy shared library.
- Built one brand's entire **authentication surface** on shared services, NgRx effects and RxJS streams, with each brand injecting its own validation into shared **Reactive Forms**. The work covered password-reset deep links, expired-token handling, and the HTTP interceptor chain that centralises auth headers and error responses.
- Sole developer on one of the six applications. I owned delivery, production defects and shifting priorities, and used **Claude Code** daily for implementation, debugging and review.
- Standardised the CSS and SCSS of the shared buttons, cards and banners. Duplicate and conflicting rules had let them drift from the design system across six brands, so I removed them.
- Watched performance and build health in **New Relic and Azure Pipelines**. Applications ship as **Docker** images deployed with **Helm into Azure Kubernetes**, and I debugged the production and CI/CD failures.
- Also worked in the Node.js backend, **Express and NestJS**, changing brand behaviour properties in MySQL.

### Senior Software Engineer, Cloud Software Group (Spotfire) (2023 - 2024, Timisoara)

- Spotfire had two ways to configure a visualisation: a legacy desktop dialog and a separate web panel, drifting apart for years. Over a multi-year project we replaced both with **one card-based panel serving desktop and web**, so a setting was built once.
- Designed and built **more than thirty reusable property cards** in Preact and TypeScript, and the framework capabilities all of them used: property formatting, help popovers, drag-and-drop reordering in grid lists, card error states, nested scrolling and search.
- Mentored the junior developers and interns building on it. I shaped the card interface to be hard to misuse, and my test for that was whether a new joiner could ship a production card in their first weeks. They could.
- Built a **slider component that several other teams picked up**.
- Ran Chromium Embedded Framework upgrades across the **C# and .NET** desktop client, and handled third-party software compliance for service-pack releases. Reviewed code continuously and presented finished work in demos.

### Software Engineer, Cloud Software Group (Spotfire) (2020 - 2023, Timisoara)

- Led flexible positioning of navigation tabs, a feature **30 organisations had asked for**, guiding a junior developer through part of it. I added action logging so we could see whether anyone actually used it.
- Delivered visualisation legend docking, **voted for by 800 users**, including getting it right in exports.
- Moved the SBDF export dialog out of **C# Windows Forms** and into the web client, removing a duplicate implementation, and presented it at a company-wide meeting. I also worked in the legacy C# and HTML codebase retiring outdated features.
- Owned a client-requested widescreen aspect-ratio feature for PowerPoint export from start to finish, working with stakeholders, UX designers and QA. I added switching between bilinear and nearest-neighbour interpolation for image inspection, and wrote my first design proposal to argue for it.
- Wrote unit, Jasmine and Cypress tests for new features, and handled support cases for high-priority clients.

### Junior Software Developer, Cloud Software Group (Spotfire) (2019 - 2020, Timisoara)

- Built a **spider-chart visualisation from scratch in D3**. Around 500 people downloaded and used it.
- Converted AngularJS JavaScript files to TypeScript for the administrative interface, and built a web-based meal-suggestion application in TypeScript and Angular configured with Webpack.
- Watched the Jenkins pipelines and worked out why builds were failing.

### Trainee System Administrator, Linux, Visma Software (Jul to Nov 2018, Sibiu)

- Built a **seven-server Debian environment on my own**: DNS, two Apache web servers, two MySQL servers in master-slave replication, and two load balancers with ldirectord and heartbeat failover on a floating virtual IP. I tested the replication under load with 22 million rows.
- Stood up **Icinga and Nagios NRPE monitoring** across every host, with per-service thresholds for load, disk, inodes, replication lag and site availability, and email alerting.
- Handled production operations tickets tracked in JIRA and documented in Confluence: vSphere template updates through Citrix, server provisioning with Chef, live LVM disk extensions, and customer SQL scripts under change management.

### Software Developer Intern, BearingPoint (Jul 2017, Sibiu)

- Built an Android chat application in Java with Firebase Authentication and Realtime Database, and presented on Android Studio and Firebase to the internship group.

## SELECTED PROJECTS

---

- **Sendflow**. A wallet transfer flow in **React and TypeScript**, 2026. The flow is one discriminated union rather than a set of booleans, so a state like pending-and-failed cannot be represented. The amount is derived rather than stored, so a send-max recomputes as the network fee moves instead of going stale. And failing before submission is a different event from failing after, because one costs nothing and the other costs the fee, so they get different words and different actions. [corinasebesan.github.io/Sendflow](https://corinasebesan.github.io/Sendflow) · [github.com/corinasebesan/Sendflow](https://github.com/corinasebesan/Sendflow)
- **Tomatology**. Master's thesis: Android application in Kotlin that identifies ten tomato leaf diseases from a photograph. I wrote the preprocessing pipeline in Python and OpenCV and trained a custom CNN in TensorFlow and Keras over **45,860 labelled images**. Preprocessing took accuracy from 82% to **roughly 98%**, ahead of all 28 off-the-shelf Keras architectures I benchmarked it against. I quantised the model from 139 MB to 11 MB and served it at runtime through Firebase ML with Remote Config, so a new version could be A/B tested in production without shipping the app again, with analytics measuring how it did on real photographs. [github.com/corinasebesan/Tomatology](https://github.com/corinasebesan/Tomatology)
- **MedicalOnTime**. Full-stack doctor appointment booking system, built solo. **Spring Boot 2.4** REST API with JPA and Hibernate over MySQL, **React 17** front end, three roles covering booking, cancellation, doctor search and treatment history. I went back to it in 2026 and threw out the placeholder login for **Spring Security**: BCrypt hashing, JWT issue and validation, and authorisation checked per endpoint and again per record. [github.com/corinasebesan/MedicalOnTime](https://github.com/corinasebesan/MedicalOnTime)
- **Music IT / MusicHub**. Innovation Labs Sibiu 2018: led a team of five to the semifinal with a platform for renting out musical instruments and booking lessons. Built the Android application in Java with Firebase Authentication and Realtime Database, and delivered every pitch across the programme, from the first business model to the closing investor presentation. [github.com/corinasebesan/MusicHub](https://github.com/corinasebesan/MusicHub)
- **Pocket Travel Guide**. Bachelor's thesis: Android application generating a personalised one-day tourist route across 31 sights in Sibiu, modelled as an orienteering problem with time windows and solved on the phone itself with a parallel pulse branch-and-bound over a precomputed bounding oracle. It integrates Google Maps, Places and Directions, QR scanning for on-site information, and Firebase for data and authentication. I went back to it in 2026 and reconnected the solver, which had shipped behind a hardcoded route. [github.com/corinasebesan/PocketTravelGuide](https://github.com/corinasebesan/PocketTravelGuide)
- **Spotify playlist redesign**. Design assignment set by TIBCO Software: Researched user complaints on the Spotify community forum, then prototyped a reworked playlist sidebar in Figma with collapsible sections per content type, per-section sorting and cross-playlist search. [Figma prototype](#)

## EDUCATION, CERTIFICATIONS AND LANGUAGES

---

**2019 - 2021: MSc Engineering, Information Technology**, Politehnica University of Timisoara, Faculty of Automation and Computers

**2015 - 2019: BEng, Information Technology**, Lucian Blaga University of Sibiu, Faculty of Engineering

**2023:** Foundations of User Experience Design, Google · [credential](#)

**2017:** Meet the Geeks, Visma. Software engineering practice (TDD, SOLID, design patterns, refactoring) and applied machine learning

**2014:** Cambridge English Level 2 Certificate in ESOL International (Advanced), C1

**Languages:** Romanian (native), English (C1, certified; working language for seven years), French (intermediate)
